

Air Plant Care Card

Light & Location:

Air plants prefer bright, indirect sunlight. They thrive under fluorescent lighting as such found in home or office lights. More direct light, such as from an East facing window, will help encourage flower and color changes. Ideal locations in the house include in the kitchen and the bathroom (high humidity rooms) and east facing windows.

Watering:

There are two methods to water your air plants, misting or soaking. Mist your air plant with water every couple of days. Alternatively, soak your air plant in water for 30-60 minutes once a week. Gently shake off excess water and allow the air plant to dry upside down or on its side on a towel. If you use a fertilizer, only fertilize once a month.

Tips:

- *Always remove your air plant from the terrarium (especially glass) prior to watering. Let dry before returning to the terrarium.*
- *To ensure water does not pool at the base of the air plant, allow plant to dry upside down if possible*
- *Never plant in soil*
- *Under watering is easier to recover from overwatering. Start off with less watering and adjust as the plant needs.*
- *If your air plant leaves are bowing inward, this is a sign of under watering.*
- *If your air plant leaves are brown and dry, this is a sign of over watering.*
- *If your plant falls apart from the inside, this is a sign the plant was over watered and rotted.*
